### Unit 6B: Day 14 and 15: Angles and Parallel Lines

Focus Question: How are angles related when there are parallel lines?

#### A. Vocabulary Review

If a transversal cuts two parallel lines, many pairs of angles formed are congruent.

same direction never cross

1. Which two lines are parallel? (mark this on the picture)

line m is parallel to line n  $m \parallel n$

2. Which line is the transversal? What does transversal mean?

line t to cross over another line

3. Angles 1 and 3 are congruent because...

they are vertical.

4. What transformation "moves" angle 5 exactly onto angle 1?

translation

5. List ALL angles congruent to angle 1. Explain why each is congruent.

$\angle 3$  b/c they are vertical

$\angle 5$  b/c its a translation

$\angle 7$   $\angle 7 \cong \angle 3$  which is vertical to  $\angle 1$  (translation)

6. What other angles are congruent to angle 2? Why?

$\angle 2 \cong \angle 6 \cong \angle 8 \cong \angle 4$   
b/c its a translation  $\angle 8 \cong \angle 6$  (vert)  $\angle 6 \cong \angle 2$  its vertical

7. Supplementary angles are angles that add up to  $180^\circ$ . We already know that linear pairs are supplementary. List two linear pairs.

$\angle 1 \& \angle 2$   $\angle 4 \& \angle 3$   $\angle 8 \& \angle 7$

8.  $\angle 1$  and  $\angle 4$  are a linear pair so they are supplementary.  $\angle 1$  and  $\angle 2$  are a linear pair so they are supplementary. Are there any other angles supplementary to  $\angle 1$ ? Explain.

$\angle 8$  b/c  $8 \& 5$  are linear and  $\angle 5 \cong \angle 1$

$\angle 6$  b/c  $6 \& 5$  are linear and  $\angle 5 \cong \angle 1$

9. List all angles that are supplementary to angle 6.

$\angle 5$  b/c its linear

$\angle 7$  b/c its linear

$\angle 3$  b/c  $\angle 6 \cong \angle 2$  and  $\angle 2$  is linear with  $\angle 3$

$\angle 1$  b/c  $\angle 6 \cong \angle 2$  and  $\angle 2$  is linear to  $\angle 1$

B. Finding missing angle measures.  
 In the diagram at the right line  $s$  and line  $t$  are parallel.  
 Find the measures of the following angles.

Give a reason for your answer!

$m\angle 1 = 87^\circ$   
 b/c its linear to  $\angle 4$

$m\angle 2 = 93^\circ$   
 b/c its vertical to  $\angle 4$

$m\angle 3 = 87^\circ$   
 b/c vertical to  $\angle 1$

$m\angle 4 = 93^\circ$   
 b/c its a translation

$m\angle 5 = 87^\circ$   
 b/c its vertical to  $\angle 7$

$m\angle 6 = 93^\circ$   
 b/c its vertical

$m\angle 7 = 87^\circ$   
 b/c its linear

C. Decide if the given angles are congruent or supplementary. Then find the value of the variable.

1.

Translate  $30^\circ$  up  
 now the  $\angle$ 's are vertical  
 so they are  $\cong$ .

$$\frac{2x}{2} = \frac{30}{2}$$

$$x = 15$$

2.

Translate  $145^\circ$  down  
 now the  $\angle$ 's are linear  
 so they are supplementary

$$\begin{array}{r} \textcircled{145} + \textcircled{x - 25} = 180 \\ 120 + x = 180 \\ -120 \quad \quad -120 \\ \hline x = 60 \end{array}$$

3.

Translate  $45^\circ$  down,  
 now they are linear  
 so they are supplementary.

$$\begin{array}{r} \textcircled{45} + \textcircled{4x + 19} = 180 \\ 64 + 4x = 180 \\ -64 \quad \quad -64 \\ \hline 4x = 116 \\ \frac{4x}{4} = \frac{116}{4} \\ x = 29 \end{array}$$

D. Practice with the provided worksheet

Pick 2

Angles in Parallel Lines Practice

Name: \_\_\_\_\_

For each picture, tell whether the angles are congruent or supplementary. Then, EXPLAIN how you know you are correct. Finally, give the value of the variable.

Picture	Congruent or Supplementary	Explanation	Value of Variable Work
	Suppl.	b/c... translate 91° & they are linear	$\begin{array}{r} x + 91 = 180 \\ - 91 \quad - 91 \\ \hline x = 89^\circ \end{array}$
	Suppl.	b/c... translate 98° & they are linear	$\begin{array}{r} 3x + 4 + 98 = 180 \\ 3x + 102 = 180 \\ - 102 \quad - 102 \\ \hline 3x = 78 \\ \frac{3x}{3} = \frac{78}{3} \quad x = 26 \end{array}$
	≅	b/c... translate 54° & they are vertical	$\begin{array}{r} 2x + 4 = 54 \\ - 4 \quad - 4 \\ \hline 2x = 50 \\ \frac{2x}{2} = \frac{50}{2} \quad x = 25 \end{array}$
	≅	b/c... transl. 4x + 10 down & they are vert.	$\begin{array}{r} 4x + 10 = 6x - 40 \\ - 4x \quad - 4x \\ \hline 10 = 2x - 40 \\ + 40 \quad + 40 \\ \hline 50 = 2x \\ \frac{50}{2} = \frac{2x}{2} \quad x = 25 \end{array}$
	Suppl.	b/c... transl. x + 20 up & they are linear	$\begin{array}{r} x + 20 + 4x - 10 = 180 \\ 5x + 10 = 180 \\ - 10 \quad - 10 \\ \hline 5x = 170 \\ \frac{5x}{5} = \frac{170}{5} \\ x = 34 \end{array}$
